### 1. Overview:

The BMP180 is a high-precision degital barometric pressure and temperature sensor develop by Bosch. It communicate using the I2C protocol, making it ideal for integration with microcontrollers and singles-board computers like the Raspberry Pi.

In this project, you will learn how to connect the BMP180 sensor to a raspberry Pi and use a custom driver to read real-time temperature and atmospheric pressure data. This guide will walk you through the necessary setup steps, wiring instructions, using the driver library, and troubleshooting any issues you may encounter.

Whether you're building a weather station, a drone altimeter or a smart IoT device, understanding how to interface with BMP180 is a great place to start.

## 3. Configuring for I2C:

Before you can get started with I2C on the Pi you'll need to run through quick steps from the console.

Check out this tutorial for more details and follow it completely:

https://learn.adafruit.com/adafruits-raspberry-pi-lesson-4-gpio-setup/configuring-i2c

When you're done, run:

```
sudo i2cdetect -y 0 (if you are using a version 1 Raspberry Pi)
sudo i2cdetect -y 1 (if you are using a version 2 Raspberry Pi)
```

This will search /dev/i2c-1 for all address.

#### - I2C Specification:

| Parameter  | Symbol                | Min.                    | Тур | Max.                    | Units |
|--|-----------------------|-------------------------|-----|-------------------------|-------|
| Clock input frequency  | f <sub>scL</sub>      |                         |     | 3.4                     | MHz   |
| Input-low level  | V <sub>IL</sub>       | 0                       |     | 0.2 * V <sub>DDIO</sub> | V     |
| Input-high level   | $V_{IH}$              | 0.8 * V <sub>DDIO</sub> |     | $V_{\text{DDIO}}$       | V     |
| Voltage output low level<br>@ V <sub>DDIO</sub> = 1.62V, I <sub>OL</sub> = 3mA | V <sub>OL</sub>       |                         |     | 0.3                     | V     |
| SDA and SCL pull-up resistor   | R <sub>pull-up</sub>  | 2.2                     |     | 10                      | kOhm  |
| SDA sink current<br>@ V <sub>DDIO</sub> = 1.62V, V <sub>OL</sub> = 0.3V        | I <sub>SDA_sink</sub> |                         | 9   |                         | mA    |
| Start-up time after power-up, before first communication                       | t <sub>start</sub>    | 10                      |     |                         | Ms    |

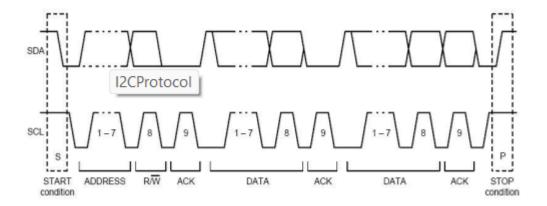

#### - I2C communication:

The I2C bus uses two signals: SDA(data) and SCL(clock). A Start condition(S) occurs when SDA falls while SCL is high and A Stop condition(P) occurs when SDA rises while SCL is high.

After the master sends 7 address bits + R/W bit:

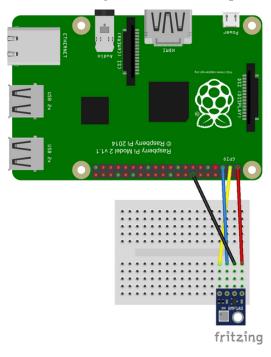

The BMP180 acknowledges by pull SDA low on the 9<sup>th</sup> clock cycle (ACK)

Data must remain stable while SCL is high, changes are allowed only when SCL is low.

# 4. Hooking up the BMP180:

Provide wiring instructions and pin mapping between the BMP180 and Raspberry Pi.

| BMP180 Pin | Raspberry Pi Pin (Physical) |  |  |  |
|------------|-----------------------------|--|--|--|
| VCC        | Pin 1 (3.3V)                |  |  |  |
| GND        | Pin 6 (GND)                 |  |  |  |
| SDA        | Pin 3 (GPIO2, SDA)          |  |  |  |
| SCL        | Pin 5 (GPIO3, SCL)          |  |  |  |

### 5. How to Build and Use the BMP180 Driver:

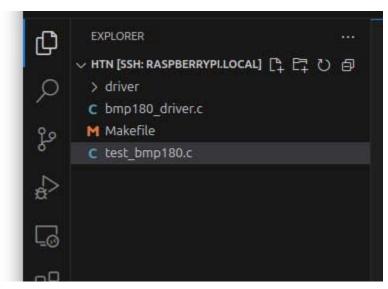

#### Check BMP180 Sensor Connection

Verify the sensor connection:

#### i2cdetect -y 1

You should see the address '0x77' in the table if the sensor is properly connected.

- Directory Structure:

This folder contains the source file, test file, and build instructions.

Example Makefile:

all: gcc -o test\_bmp180 test\_bmp180.c bmp180\_driver.c -lwiringPi

To build the project, run:

make

| o run the program:   |
|--|
| gcc test_bmp180.c -o test_bmp180.c   |
| sudo ./test  |
| - Kernel Module Loading with insmod:   |
| he following command is used to load a kernel module (.ko file) into the Linux kernel: |
| - sudo insmod bmp180_driver.ko   |
